

Speaker: The film industry has obviously benefited from technology. Computer-generated graphics have created unbelievable scenes on the film screen. Areas that you might not have thought about are areas like film editing. Computers have also made behind the scenes editing that is so important, so very different including the area of sound editing. Robotic technology and remote controlled devices have allowed great freedom in creating everything from fantasy characters to controlled explosions and realistic miniatures. Camera technology has evolved too to the point where cameras are much lighter, much nimble making handheld shots possible.

As well as placing cameras in tight spots and again, using them in miniatures. The development of synthetic materials, particularly mold-able synthetics have given freedom to make up artists and costume artist to go wild. The nice thing about DVD technology is that it's brought extra segments in addition to the main attraction into our homes. We can go behind the scenes and see what these really amazing artists do in order to create believability in the unbelievable.
